In re U.S. Patent No. 6,955,278	:	
Inventor: Willy Lorscheidt	:	Group Art Unit 3754
Issued: October 18, 2005	:	Examiner F. C. Nicolas
For: DISPENSER FOR PASTY PRODUCTS	:	Docket No. 19559

REQUEST FOR ISSUANCE OF A CORRECTED PATENT  
UNDER 37 C.F.R. § 1.322 (b)

Commissioner for Patents  
P. O. Box 1450  
Alexandria, VA 22313-1450

Sir:

In accordance with the provisions of 37 C.F.R. § 1.322(b), Applicant requests that a corrected patent be issued owing to a mistake on the part of the office such that a certificate of correction is deemed inappropriate in form.

More particularly, it is noted that many errors are contained in the claims of the printed patent, including at least patent claims 1, 12, 13, 16, and 17. The patent claims do not correspond with the allowed claims as amended by the Examiner's Amendment that accompanied the Notice of Allowance dated April 28, 2006.

To correspond with the Examiner's Amendment, the amended claims should read as follows:

1. A dispenser for dispensing a paste-like product, comprising:

(a) a generally cylindrical hollow container (1) having a vertical longitudinal axis (X) and upper and lower ends, said container including intermediate said ends a transverse wall (10) that defines in said container a lower chamber (10a) for receiving the paste-like product, and an upper delivery chamber (100) having a cylindrical wall defined on an inner sleeve portion (13) of said container, said lower chamber containing a vertically displaceable follower piston (22), said transverse wall containing a discharge opening (11) containing valve means (20)

that permit the flow of a variable volume of the paste-like product from said lower chamber to said upper delivery chamber when the pressure of said lower chamber exceeds that of said upper chamber;

(b) a generally cylindrical main headpiece (3) arranged above said transverse wall for vertical displacement relative to said container, said headpiece having upper and lower ends, said lower end containing an internal chamber having a top wall (35), said internal chamber having an inner cylindrical side wall that defines bushing means (31), said headpiece containing at said upper end a laterally extending product discharge channel (32) in communication with said internal chamber;

(c) a generally cylindrical vertically arranged delivery piston (5) arranged for vertical sliding movement relative to said container, said piston having an upper end (50) that extends within said headpiece internal chamber and terminates in an upper end wall (54), said piston having a lower end (52) that is in sliding engagement with said delivery chamber cylindrical wall, said piston containing a vertical longitudinal delivery channel (50a) having a lower end containing an inlet opening (53) in communication with said delivery chamber, said delivery piston upper end containing at least one radial outlet opening (58) in communication with said longitudinal delivery channel; and

(d) spring means (7) biasing said headpiece upwardly toward a first position relative to said container;

(e) said delivery piston having a first position relative to said container such that when said main headpiece is in said first position, the upper end of said delivery piston is spaced by a given axial distance (a) from said main headpiece upper wall, and said delivery piston outlet opening is closed by an upper first surface portion (31b) of said bushing means;

(f) said main headpiece being longitudinally displaceable downwardly relative to said

container and said piston toward a second position in which said headpiece top wall engages said piston upper wall, and said bushing means first surface portion is displaced to an open position relative to said delivery piston outlet opening;

(g) said headpiece being downwardly displaceable from said second position toward a third position relative to said container, thereby causing said piston to be displaced by said headpiece to a second position relative to said container, whereby the pasty-like product is pumped from said delivery chamber to said product discharge channel via said piston longitudinal discharge channel and said piston outlet opening.

2. The dispenser according to claim 1, characterized in that the headpiece bushing means includes a lower second bushing surface portion (31a) which guides the delivery piston in a longitudinally displaceable manner and which comprises at least one guide surface cooperating with the circumferential surface of the delivery piston.
3. The dispenser according to claim 1, characterized in that the headpiece (3) and the delivery piston have provided thereon entraining means (34, 57) by which the delivery piston is entrained after manual operation during resetting of the headpiece (3) into the initial first position.
4. The dispenser according to claim 3, characterized in that said entraining means includes an entraining shoulder (67) which cooperates with an entraining rim (34) formed on the delivery piston.
5. The dispenser according to claim 4, characterized in that the entraining shoulder (34) is provided at the end side on the bushing means (31) at the transition to the discharge channel (32), and the entraining rim (57) is provided in the end portion of the delivery shaft (50) at the front side.
6. The dispenser according to claim 1, characterized in that the delivery piston (51) projects

radially outwardly to define an annular contact surface (51a), and that the guide bushing means (31) has a pressure end surface (33) that is arranged in the initial position at said given axial distance relative to the annular contact surface (51a) and is positioned by axial displacement of the headpiece (3) toward the container (1) on the annular contact surface (51a).

7. The dispenser according to claim 1, characterized in that the inner wall of the delivery chamber (100) is formed by the inner sleeve portion (13) of the container (1) adjacent the headpiece (3).

8. A dispenser for dispensing a paste-like product, comprising:

(a) a generally cylindrical hollow container (1) having a vertical longitudinal axis (X) and upper and lower ends, said container including intermediate said ends a transverse wall (10) that defines in said container a lower chamber (10a) for receiving the paste-like product, and an upper delivery chamber (100) having a cylindrical wall defined on an inner sleeve portion (13) of said container, said lower chamber containing a vertically displaceable follower piston (22), said transverse wall containing a discharge opening (11) containing valve means (20) that permit the flow of a variable volume of the paste-like product from said lower chamber to said upper delivery chamber when the pressure of said lower chamber exceeds that of said upper delivery chamber;

(b) a generally cylindrical main headpiece (3) arranged above said transverse wall for vertical displacement relative to said container, said headpiece having upper and lower ends, said lower end containing an internal chamber having a top wall (35), said internal chamber having an inner cylindrical side wall that defines bushing means (31), said headpiece containing at said upper end a laterally extending product discharge channel (32) in communication with said internal chamber;

(c) a generally cylindrical vertically arranged delivery piston (5) arranged for vertical sliding

movement relative to said container, said piston having an upper end (50) that extends within said headpiece internal chamber and terminates in an upper end wall (54), said piston having a lower end (52) that is in sliding engagement with said delivery chamber cylindrical wall, said piston containing a vertical longitudinal delivery channel (50a) having a lower end containing an inlet opening (53) in communication with said delivery chamber, said delivery piston upper end containing at least one radial outlet opening (58) in communication with said longitudinal delivery channel;

(d) spring means (7) biasing said headpiece upwardly toward a first position relative to said container;

(e) said delivery piston having a first position relative to said container such that when said main headpiece is in said first position, the upper end of said delivery piston is spaced by a given axial distance (a) from said main headpiece upper wall, and said delivery piston outlet opening is closed by an upper first surface portion (31b) of said bushing means;

(f) said main headpiece being longitudinally displaceable downwardly relative to said container and said piston toward a second position in which said headpiece top wall engages said piston upper wall, and said bushing means first surface portion is displaced to an open position relative to said delivery piston outlet opening;

(g) said headpiece being downwardly displaceable from said second position toward a third position relative to said container, thereby causing said piston to be displaced by said headpiece to a second position relative to said container, whereby the pasty-like product is pumped from said delivery chamber to said product discharge channel via said piston longitudinal discharge channel and said piston outlet opening, and

(h) a generally cylindrical mating headpiece (4) connected with said container for guiding said main headpiece, said mating member having an outer holding cylindrical portion (41) arranged concentrically about said container inner sleeve portion, and an inner tubular guide
